APPENDIX F - Preliminary Construction Information for EIR Air Quality and Traffic Analyses for the Central Corridor

This appendix provides preliminary construction information for the Central Corridor related to quantities of equipment and vehicle use, employee travel needs, and earthwork needed to develop air quality and traffic analyses in the EIR. The information is provided in the following attachments organized by project design capacity option:

- Attachment 1. Project Design Capacity for 6,000 cfs
- Attachment 2. Project Design Capacity for 7,500 cfs
- Attachment 3. Project Design Capacity for 3,000 cfs
- Attachment 4. Project Design Capacity for 4,500 cfs
- Attachment 5. Additional Information for Stockpile Information, Concrete Batch Production, and Power Demand

Each attachment includes workbooks which are organized along the conveyance alignment from the intakes to the Southern Complex, as follows:

- Access roads and park and ride lots for intakes and intake sites
- Access roads, railroad access, ring levee, and the Twin Cities Complex
- Access roads, levee improvements (if applicable), and tunnel shaft sites between Twin Cities Complex and Southern Complex
- Access roads, Southern Complex on Byron Tract, and Southern Complex located to the west of Byron Highway

Common features are not repeated in this Engineering Project Report Update. For example, the Hood-Franklin Road Park and Ride Lot is included for every project design capacity option; and therefore, is only included in Attachment 1 for Alternative 1B.

For each feature, the construction information is provided in a format requested by the DCO, including Schedule, Offroad Diesel equipment use, Offroad Electrical equipment use (not including Tunnel Boring Machines – see Power Demand), Onroad vehicle and equipment use, Marine equipment use, Locomotive use, Helicopter use, Earthmoving volumes, Demolition.

The construction air quality analyses assume that the construction specifications would require use of commercially-available electric equipment and vehicles to reduce gasoline and diesel needs, including cranes and trucks. For equipment and vehicles not available as electrically-driven, the specifications would require use of commercially-available hybrid-diesel equipment and vehicles which reduce the use of diesel fuel especially during idling periods. The diesel-driven engines would use renewable diesel fuels.

The construction air quality analyses assume that all circuit breakers would be insulated with SF₆-gas-insulated switchgear. This assumption is conservative because the State of California has adopted regulations banning SF₆ circuit breakers after 2033 as vacuum or very low-GWP gas insulated breakers become commercially available.

This appendix was developed to provide DWR for consideration during the EIR air quality emissions and traffic analyses. This information was developed assuming that construction would begin in “Year 2026” without consideration of the future schedule for the EIR or permitting processes. The construction activities presented in this appendix were developed based upon a construction period ranging from one to fourteen years depending upon the project feature. The level of effort and duration of the activities would be the same regardless of the actual initial year of construction. Therefore, the items presented in this appendix were provided to DWR assuming the following chronological translation factors.

- Year 2026 = Construction Year 1
- Year 2027 = Construction Year 2
- Year 2028 = Construction Year 3
- Year 2029 = Construction Year 4
- Year 2030 = Construction Year 5
- Year 2031 = Construction Year 6
- Year 2032 = Construction Year 7
- Year 2033 = Construction Year 8
- Year 2034 = Construction Year 9
- Year 2035 = Construction Year 10
- Year 2036 = Construction Year 11
- Year 2037 = Construction Year 12
- Year 2038 = Construction Year 13
- Year 2039 = Construction Year 14
